

12th December 2017

To whom it may concern,

ARI Fleet Management Corporation are the world's largest privately held fleet management company. We pride ourselves on improving our customer's fleet management operations and ultimately their bottom line.

Earlier this year we approached our road side assistance partner, The RAC, on the issues many of our customers were having with the diesel particulate filter (DPF) on relatively new diesel light commercial vehicles. ARI's London vehicle fleets seem to suffer more problems in this area due to the "stop/start" journey patterns.

The RAC introduced ARI to Cataclean Global Limited and their fuel and exhaust system cleaner, Cataclean. In conjunction with the RAC, Cataclean designed a testing programme for one of ARI's customers on eight Peugeot Partner HDI vans operating in London. The eight vans are part of a fleet of around 400 vehicles. Following the test period the RAC concluded that the Cataclean treatment across the test vehicles improved the performance of the DPF's by 27%, reduced emissions across CO₂/HC/NOX by 24% and improved fuel consumption by 9.7%.

ARI are very pleased with this initiative's initial results and would recommend similar trials to our customer's fleets.

Yours faithfully

Matt Cranny
Operations Director
